Wireframe-Style Screen Specification
Lo-fi screen pack to support developer quoting, scope clarification, and acceptance testing.

Document purpose. Translate the MVP build spec into screen-by-screen wireframes and UI behaviour notes so a developer can quote with less ambiguity.

Coverage. User-facing extension flow, website report flow, and admin/operator workflow for merchant review and report moderation.

Out of scope for this pack. Visual design polish, brand artwork, advanced automation, scraping logic, merchant billing, and AI scoring.

Screen inventory

ID	Screen	Actor	Primary purpose
EXT-01	On-page signal badge	Shopper	Show verdict on the visited domain at a glance.
EXT-02	Extension popup	Shopper	Display verdict, reasons, and next actions in under 5 seconds.
WEB-01	Full merchant report	Shopper	Give deeper rationale without cluttering the popup.
WEB-02	Report this store form	Shopper	Collect structured consumer caution reports.
ADM-01	Admin login	Operator	Secure access to the control room.
ADM-02	Merchant database list	Operator	Search, filter, and open merchant records fast.
ADM-03	Merchant assessment detail	Operator	Review a merchant, score pillars, and publish verdicts.
ADM-04	User reports queue	Operator	Review incoming reports and trigger reassessment.

EXT-01 On-page signal badge

Primary actor Shopper

Primary purpose	Expose the current merchant verdict without forcing the user to open a full panel.
------------------------	--

Key actions • Read current domain from active browser tab. • Request merchant verdict from backend API. • Render one compact verdict state: Trusted, Caution, High Risk, or Insufficient Data. • Allow click-through into the full popup. Core fields / content • RateIt label or icon. • Verdict label. • Optional compact colour/state treatment. • Small hover/click affordance.	States / edge cases • If domain is unknown, show Insufficient Data rather than fake confidence. • If API is unavailable, show neutral fallback like 'Unavailable'. • Badge must not block checkout buttons or key page actions. Quote note Keep this tiny. A developer quote should treat it as a lightweight injected UI element, not a full overlay system.

EXT-02 Extension popup

Primary actor	Shopper
Primary purpose	Summarise trust posture, reasons, and next steps in under 5 seconds.

Key actions • Open from extension icon or on-page badge. • Show verdict and support line. • Show four-pillar snapshot. • Provide 2-3 next-step buttons. Core fields / content • Store domain. • Last reviewed date. • Verdict. • One-line explanation. • Transparency / Reliability / Integrity / Communication states. • Top reasons. • Buttons: View Full Report, Report This Store, Why This Rating?	States / edge cases • Trusted, Caution, High Risk, and Insufficient Data all use same layout. • If no full report exists yet, View Full Report can route to a simple pending page. • If popup content exceeds vertical space, reasons should truncate cleanly. Quote note Most of the user-facing value sits here. This screen deserves explicit acceptance criteria and should be quoted carefully.

WEB-01 Full merchant report page

Primary actor	Shopper
Primary purpose	Provide deeper detail than the popup without overwhelming the shopper.

Key actions • Load by merchant domain or record ID. • Show current verdict and freshness. • Explain each pillar in plain English. • Offer consumer caution notes and reporting path. Core fields / content • Merchant name and domain. • Verdict. • Summary paragraph. • Per-pillar rating plus short explanation. • Top positive signals. • Top warning signals. • Consumer caution notes. • Link to report form.	States / edge cases • If merchant is Insufficient Data, page should encourage review request or report submission. • If merchant record is unpublished, route to safe fallback page. • Should be usable on mobile web later even if MVP is desktop-first. Quote note Developer quote should treat this as a simple templated page backed by the merchant record, not a CMS-heavy content project.

WEB-02 Report this store form

Primary actor	Shopper
Primary purpose	Collect structured reports that are useful enough for moderation and reassessment.

Key actions • Pre-fill current domain when possible. • Let user choose report type. • Capture concise narrative and optional evidence link. • Submit report and show acknowledgement. Core fields / content • Domain or store name. • Report type. • Description. • Optional email/contact. • Optional screenshot or URL placeholder for later. • Consent / accuracy acknowledgement.	States / edge cases • Anonymous reporting can exist, but spam controls may still be needed. • If current domain is unknown, user can still submit a report. • Attachment upload can be deferred in v1 if quote pressure is high. Quote note Attachment handling can expand time/cost fast. Good to quote optional upload support separately.

| [_____] |
| Evidence URL (optional): [_____] |
| Email (optional): [_____] |
| [ ] I believe this report is accurate to my use. |
| [Submit report] |
+-----+

```

ADM-01 Admin login

Primary actor Operator

Primary purpose Protect the backend and separate operator actions from public user flows.

Key actions

- Enter credentials.
- Authenticate.
- Route authorised users to merchant list.
- Block unauthorised access.

Core fields / content

- Email / username.
- Password.
- Forgot password or reset path.
- Basic error messaging.

States / edge cases

- Locked account or invalid login state.
- Future multi-user roles can wait if MVP needs only one admin role.
- Can be standard framework auth rather than custom.

Quote note

Use standard auth. Do not let a developer over-engineer this in the quote.

| Password [_____] |
|         |
| [Sign in]      |
| Forgot password|
+-----+
```

ADM-02 Merchant database list

Primary actor Operator

Primary purpose Let operators find and open merchant records quickly.

Key actions • Search by merchant name or domain. • Filter by verdict or status. • Open record detail screen. • Create new merchant record. Core fields / content • Search field. • Filters: verdict, review status, last reviewed window. • Table columns: merchant, domain, verdict, status, last reviewed, next review. • New merchant button.	States / edge cases • Large datasets need pagination later; MVP can start with simple list + search. • Default sort should favour recently reviewed or recently changed records. • Unknown domains can be created from report queue flow. Quote note Treat this as an operator workhorse screen. Filtering, table behaviour, and row-click/open should be clearly scoped.

ADM-03 Merchant assessment detail

Primary actor	Operator
Primary purpose	Review one merchant, score pillars, capture rationale, and publish verdict.

Key actions • View merchant identity and evidence sources. • Set pillar ratings. • Log red flags. • Write internal rationale and public summary. • Save draft or publish verdict. Core fields / content • Store name, domain, category. • Assessment depth and evidence quality. • Four pillar ratings + notes. • Red-flag list + severity. • Internal rationale. • Public summary line. • Top reasons. • Status and next review date.	States / edge cases • Draft, Active, Under Review, and Escalated states. • Publishing should require required fields, not just any partial save. • Verdict history is useful but can be lightweight in MVP. Quote note This is the heart of the backend. A quote should separate simple CRUD from any workflow logic such as publish controls or revision history.

+-----+

```

ADM-04 User reports queue

Primary actor Operator

Primary purpose Review incoming consumer reports and decide whether they should change merchant state or prompt reassessment.

Key actions • List incoming reports. • Filter by status or domain. • Open report detail. • Approve, dismiss, merge, or escalate. • Create merchant record if domain is new. Core fields / content • Report ID. • Merchant/domain. • Report type. • Submitted date. • Status. • Summary excerpt. • Action buttons or row actions.	States / edge cases • Spam or low-quality reports need dismissal path. • Multiple reports on same domain should be mergeable later even if MVP starts with single-item handling. • Escalation can simply create a task flag inside merchant record. Quote note Good screen for quoting optional workflow rules separately. Simple moderation is cheap; advanced triage is not.

Summary: hidden recurring billing concern after checkout.					
[Open merchant] [Create merchant] [Dismiss] [Escalate] [Mark reviewed]					
+-----+					

Quote-control notes

- Ask for separate line items for browser extension, backend/admin, and public report pages. That prevents one blurry total from hiding cost drivers.
- Treat file upload / screenshot attachments as optional. They can materially increase complexity.
- Treat automated scraping, AI scoring, and merchant self-service as Phase 2 or later, not MVP obligations.
- Require acceptance against concrete behaviours: domain lookup, verdict display, merchant publish flow, and report submission.

MVP acceptance checklist

✓	Acceptance item
☐	The extension identifies the active domain and requests verdict data from the backend.
☐	The popup renders all four verdict states without layout breakage.
☐	A merchant can be created, edited, saved, and published from the admin panel.
☐	Public report pages display summary, pillar states, and top reasons from stored merchant data.
☐	A shopper can submit a store report and an operator can review it from the report queue.
